

# Agent Security Drill Kit

Browser-only trust console for enterprise agent demos.

Local policy checks, prompt-injection drills, audit schema,  
A2A identity starter, AI Studio drill prompt, and fix queue.

Repo: <https://github.com/TateLyman/agent-security-drill-kit>

# The Problem

Agent demos are easy to ship and hard to trust.

Teams need evidence for what the agent can access, what gets denied, what requires review, and what gets logged before an enterprise pilot.

Hackathon judging has the same gap: working demo plus security proof.

# What It Does

Loads a local project folder or pasted project notes in the browser.  
Scores policy, prompt-injection handling, exfiltration controls,  
tool scope, filesystem/network boundaries, human review, tests, CI,  
documentation, A2A identity, Gemini key safety, and audit trails.

Exports a concise fix order and reusable trust artifacts.

# Outputs

Policy starter for denied actions and human review gates.

A2A-style Agent Card for identity and capability claims.

Audit-event schema for evidence-backed reviewer handoffs.

Gemini / AI Studio adversarial drill prompt.

Submission summary and prioritized patch queue.

# Why It Fits TechEx

Agent security and governance layer for intelligent enterprise workflows.

Runs safely with no real credentials and no server requirement.

Designed for buyers, sponsors, judges, and technical reviewers.

The business path is security-readiness reports for agent pilots, hackathon teams, sponsor demos, and customer handoffs.
